

# WHAT IS SENSORY ANALYSIS?

The use of *people* as *instruments* to *measure* sensory response to stimuli.

# Flavor defined by Morton Meilgaard

---

*“the term used to describe the complex interaction of taste, smell, and chemical irritation of foods in the mouth that add to its mouth-feel, such as carbonation, the burn of chili peppers, or the coolness of menthol”*

# Flavor is made up of:

## Basic Tastes

## Aromatics

- Olfactory stimulation
- Trigeminal nerve stim

## Mouthfeels

- Chemical or physical sensations
- Astringent, dry/tannin, bite, burn, etc

# What *can* we taste?

- Sweet
- Sour
- Salty
- Bitter
- *Umami*
  - ▣ response to salts of glutamic acids like MSG. Processed meats, cheeses, and soy sauce also contain glutamate

The “receptor map” is dead!

*Hanig 1901, turned over by Collings, 1974*

# Can you smell sweet?

- Perception of flavor is a combination of sensory stimuli
  - ▣ Basic Tastes 5%
  - ▣ Smell is 90%
  - ▣ Touch 1% (trigem)
  - ▣ Balance is vision, hearing, etc

**No, you can't!**

**But, Aroma can be an  
*Indicator* of flavor**

# Trigeminal & Tactile Sensation

- Carbonation
  - ▣ Related to level, partial pressure
  - ▣ Pain
  - ▣ Can increase perception of bitterness
- Fullness
  - ▣ Function of residual solids
  - ▣ Dextrins and Oligosaccharides (complex sugars)
- After feel
  - ▣ Astringency
  - ▣ Pain (chili peppers)

# Aroma:

- The human nose is very sensitive  
*More sensitive than a gas chromatograph!*
- Perception changes based on situation
- Smell with sniffs in short burst for 1-2 seconds. After this receptors become saturated and can require 20 seconds +/- to reset
- Don't forget to exhale

# The Flavor Unit

- Concept introduced by Dr. Morton Meilgaard
  - ▣ Recognized 100's of compounds in beer
  - ▣ There are different thresholds for chemicals we can taste.
    - Example:
      - Ethanol 50 grams / Liter (50,000+ ppm)
      - S-Methyl Mercaptan 4 nanograms per Liter!!  
10<sup>-9</sup> grams per Liter  
(.0000001 ppm!)
  - ▣ Need a way to compare
    - One flavor unit = the starting threshold that a compound can be detected by the olfactory
    - Ethanol at 50 grams/Liter = 1 flavor unit
    - S-Methyl Mercaptan at 8 nanograms per Liter = 2 flavor units

*Allows apples to apples comparison*

# BASIC TRAINING

What it comes down to is everyone who touches your beer should know how to talk about your beer!

# WHO?

- Beer school for all new hires
- Brewer / Cellar / Lab
- Packaging
- Sales / Marketing
- Distributors
- Festivals / Tours / Promotions

# HOW and WHEN?

- Schedule Panels as Meetings
  - Keep Consistent - same time and location
  - Goal is Regular Attendance
- Work it in so people look forward to it
  - End of Meetings
  - Shift Changes
  - Break in the Day

# BEER SCHOOL

## WHAT MAKES YOUR BEERS SPECIAL

- What is in it?
- Appearance / Aroma
- Taste / Flavor Characteristics / Aftertaste
- Style / Alcohol % / IBU
- Availability
- Food Pairings

# YOUR BEER?

- Know the aroma and flavor characteristics of all your beers
  - ▣ MALTS
  - ▣ HOPS
  - ▣ YEASTS
  - ▣ SPICES

**Whatever is in it have available for reference**

# Vocabulary & Recognition

- Use reference standards
  - i.e. spikes, aroma vials, malt, hops
- Repetition is the key to learning
- Don't Rush It!
  - Build vocabulary slowly to take pressure off
- Spikes
  - These are your Lego Blocks!

# Teaching What and Why

- Common off aroma / flavor checks
  - Diacetyl Rests
- Aroma and tastings through-out the brewing processes
  - From Wort to Package
- Technical Feedback
  - True to Brand / Consistency

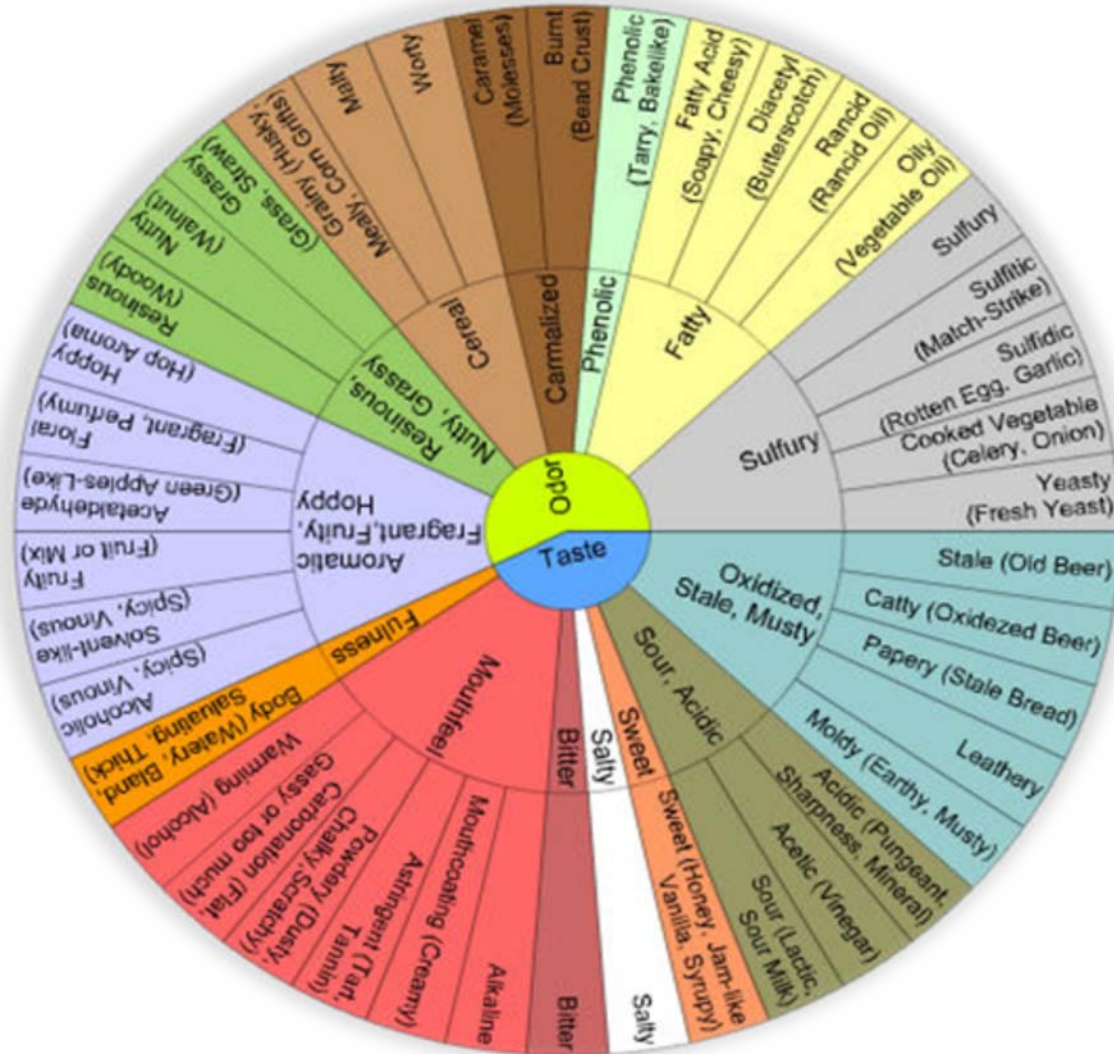

# BUILDING BLOCKS

- No Pressure Panels
- Build up your own Attribute Library
  - Everyone Participates / Good Motivator
- Lower threshold levels
- Different Styles
- Oxidation Stages
- Brand Recognition

# Flavor Wheel

# SETTING UP FOR SUCCESS

Teach the Basics and Share as Much as Possible

**APPEARANCE** (Clarity and Chill Haze)

**AROMA**

**SERVE AT AN APPROPRIATE DRINKING TEMPERATURE**

**TASTE (Don't DRINK!)**

Scoring System

**AFTERTASTE**

We don't spit beer!

**BLIND TASTING** (Fair and Good Practice)

**LIMIT THE NUMBER OF BEERS TO AVOID TASTEBUD BURNOUT**

**PALATE CLEANSERS** (Plain Crackers and Water)

**LEARN / TEACH TO NOT FINISH THE WHOLE SAMPLE**

# MOTIVATION

- **Change things up / variety**
  - Different types of Panels
    - Aroma Vials, Spikes, Triangle Tests, Preference
  - Everyone learns differently
- **Positive Rewards**
- **Feedback and Guidance**
- **SERIOUS BUSINESS BUT FUN!**

# TRAINING, VALIDATION AND FEEDBACK OF A PRODUCTION/MARKET RELEASE PANEL

Cathy Haddock

Sensory Specialist Quality Assurance Dept. Sierra Nevada Brewing Co.

CBC Annual Meeting, 2011

# Why is it important to have a trained and validated panel?

- **A trained sensory panel is a valuable instrument; each taster being a unique tool in the toolbox.**
  - Can not rely on just 1 opinion. Everyone has their own sensitivities.
- **Example: Brew master who is blind to diacetyl is the sole taster for release of product to market. Not good!**

# What is a Production Release Panel?

- Production Release Panel-a trained panel that evaluates product to be release to market.
- Panel can use various quality control tests such as a go-no go, in/out yes/no, pass/fail, quality ratings, etc. format.

# Training Process- Production Release Panel

□ If you are on the Production Release Panel you must be trained and validated on off flavor recognition and brand attribute!!

# What to train with??

Train using spiking compounds.

- Flavor Activ...quick, easy, good shelf life, but costly, cost varies per compound.
- Seibel Training Kit....quick, easy, shorter shelf life (2 months-refrigerated), 25 vials for \$180.
- Sigma Aldrich Flavor and Fragrances Kit-some dilution prep work. 22 vials for \$473. No DMS or Acetaldehyde. Good shelf life.

# Next Steps

- Identify what key flavors and off flavors are important and train on those compounds.
- Recommend spiking and training with a flagship brand, as well as any other brands if time and expense is available.

**A spiking in one brand, can come across different in another brand.**

# Types of Training and Test Methods

## Types of Training/Validation Methods:

- **Off Flavor Recognition Testing**-present panelist with spiked beer samples for evaluation and identification. *Recommend 6 samples in a session.*
- **Brand Attribute**-training with pantry reference standards, one-on-one and group exercises.
- **Sensitivity Threshold Testing**-provides training on how compounds are perceived at various concentrations as well as gain insight on panelist sensitivities.

# Tasters report from test session-taste panelists are known by a 4 digit code

# Off Flavor Recognition- Spreadsheet

# Charts allow visualization of taste panel recognition abilities.

2010 Attribute Recognition

# Brand Attribute Training

- Determine what are the key attributes in your brand and associated descriptors.
- Find Reference Standards to demonstrate those attributes.

Example: Fruit note in Sierra Nevada Pale Ale is our yeast; make yeast cake and serve side by side with the beer.

- As a Panel, discuss changes in those attributes in different ages of beer.

# Threshold Testing-

## ASBC Method of Ascending Limits

- 6 triangle tests
- Go from lowest to highest concentration with threshold in the middle.
- Test samples increase in concentration, usually 2-fold.
- Get Best Estimate Threshold of group; geometric mean of the highest concentration missed and next higher (adjacent) concentration.
- Get an individual and panel BET average.
- Take into account amount of compound in beer matrix.

### THRESHOLD OF ISOAMYL ACETATE

Procedure:		ASBC Sensory Analysis - 9 (Ascending Method of Limits)						Number of Assessors:		26	
Medium:		Miller High Life						Dilution Factor:		2

#### Statistical Summary:

Group Best Estimate Threshold (BET), ppm =				1.09
Sum Log 10 =				1.114
Average Log 10 =				0.056

Data collected at 2005 ASBC  
workshop by Everett Boiling

# Graph of Individual Tasters BET

# More than Performance Feedback, ...say Thank You!!

**It takes a time and commitment to be on panel. A lot of training is involved.**

Say “Thank you” with a .....

- ☐ Post-sensory treat/snack
- ☐ Rewards Program-gift certificates, prizes, etc.  
(Frequent Tasters Reward Program)
- ☐ End of the year parties
- ☐ Positive Feedback-be a cheer leader
- ☐ Free Beer!!

**SENSORY STATISTICS:**  
TRANSFORM YOUR SUBJECTIVE  
TASTE PANEL INTO AN  
OBJECTIVE MEASUREMENT.

# Beer's job is to deliver 10 minutes of pleasure...

So, we need to:

- Understand your brand's flavor profile: TTB (trueness to brand). Know the difference between normal process variation, process trends and/or anomalies. Consistency! Identify and classify flavors and determine their desired levels for a given brand. Then, pinpoint their origins from grain to glass/processing.
- Provide specific- technical- actionable flavor interpretations to help production correct flaws, identify trends and better control the outcome of each brew.
- Keep it simple, thorough repeatable, reproducible test method and data analysis.

# What do I do with my production release data results?

- ▣ How bad is 'too bad'? Sellable vs. non-sellable finished product.
- ▣ What is normal/natural process variation?
- ▣ What is out of specification? What warrants investigation?
- ▣ How can you avoid flavor shift over time?
- ▣ Is the product defect enough to cause the consumer to notice? Complain? Recall?!?

Need to Move away from grading. 1 out of 10 panelist (no go)  $\neq$  90% A. What about 3 of 20? 85% B- 3 diacetyl comments?!?!

Move away from tests that generate limiting, unactionable, un'mine'able data – scaling, ttt. Final score = 16- 76%

# (P)robability control charts-

## sleep well through the power of simple statistics!

### The perfect tool for Sensory Finished Product Release Panel Analysis:

- A p-chart (probability chart) is an attributes (ttb or not ttb) control chart that consists of points collected and plotted with the control/natural process limits from data in subgroups of varying sizes (different number of and panelists every panel).
- Think of the limits as the 'voice' of your process. P-charts monitors normal variations: whether your process is stable and predictable and determines whether a particular sample falls within the normal variation or falls outside and needs to be examined further. Can also monitor the effects of process improvement theories (test brew validation) or spikes (panel validation).
- P-charts can easily be created using simple excel add-ins that are pretty cheap and easy!

# Production Release Ballot and Data Entry

Sample	1	2	3	4	5	6	7	8
<b>V</b> isual								
<b>A</b> roma								
<b>F</b> lavor								
<b>M</b> outhfeel								
<b>O</b> verall								
<b>COMMENTS</b>								

- Check it out-  
probability  
charts in  
action....  
Looks like your  
normal data  
entry  
spreadsheet.

The image shows the Microsoft Excel ribbon with the following tabs: Home, Insert, Page Layout, Formulas, Data, Review, View, Developer, and Add-Ins. The ribbon is divided into several groups:

- Clipboard:** Includes icons for Paste, Cut, Copy, and Format Painter.
- Font:** Includes options for font face (Calibri), size (11), bold (B), italic (I), underline (U), text color, and background color.
- Alignment:** Includes options for text alignment (left, center, right, justified), wrap text, and merge & center.
- Number:** Includes options for number format (General, currency, percentage, decimal, scientific, fraction, text, date, time, custom).
- Conditional Formatting:** Includes options for conditional formatting, format as table, and cell styles.
- Cells:** Includes options for insert, delete, and format.
- Editing:** Includes options for AutoSum, fill, clear, sort & filter, and find & select.

# Normal process variation.

# Out of Control data patterns- alert!

## Your process is changing behavior!!

One or more points outside of the control limits

7 consecutive points on the same side of centerline

7 consecutive intervals entirely increasing or decreasing

2 out of 3 consecutive points in the same zone A or beyond

14 consecutive points alternating up and down

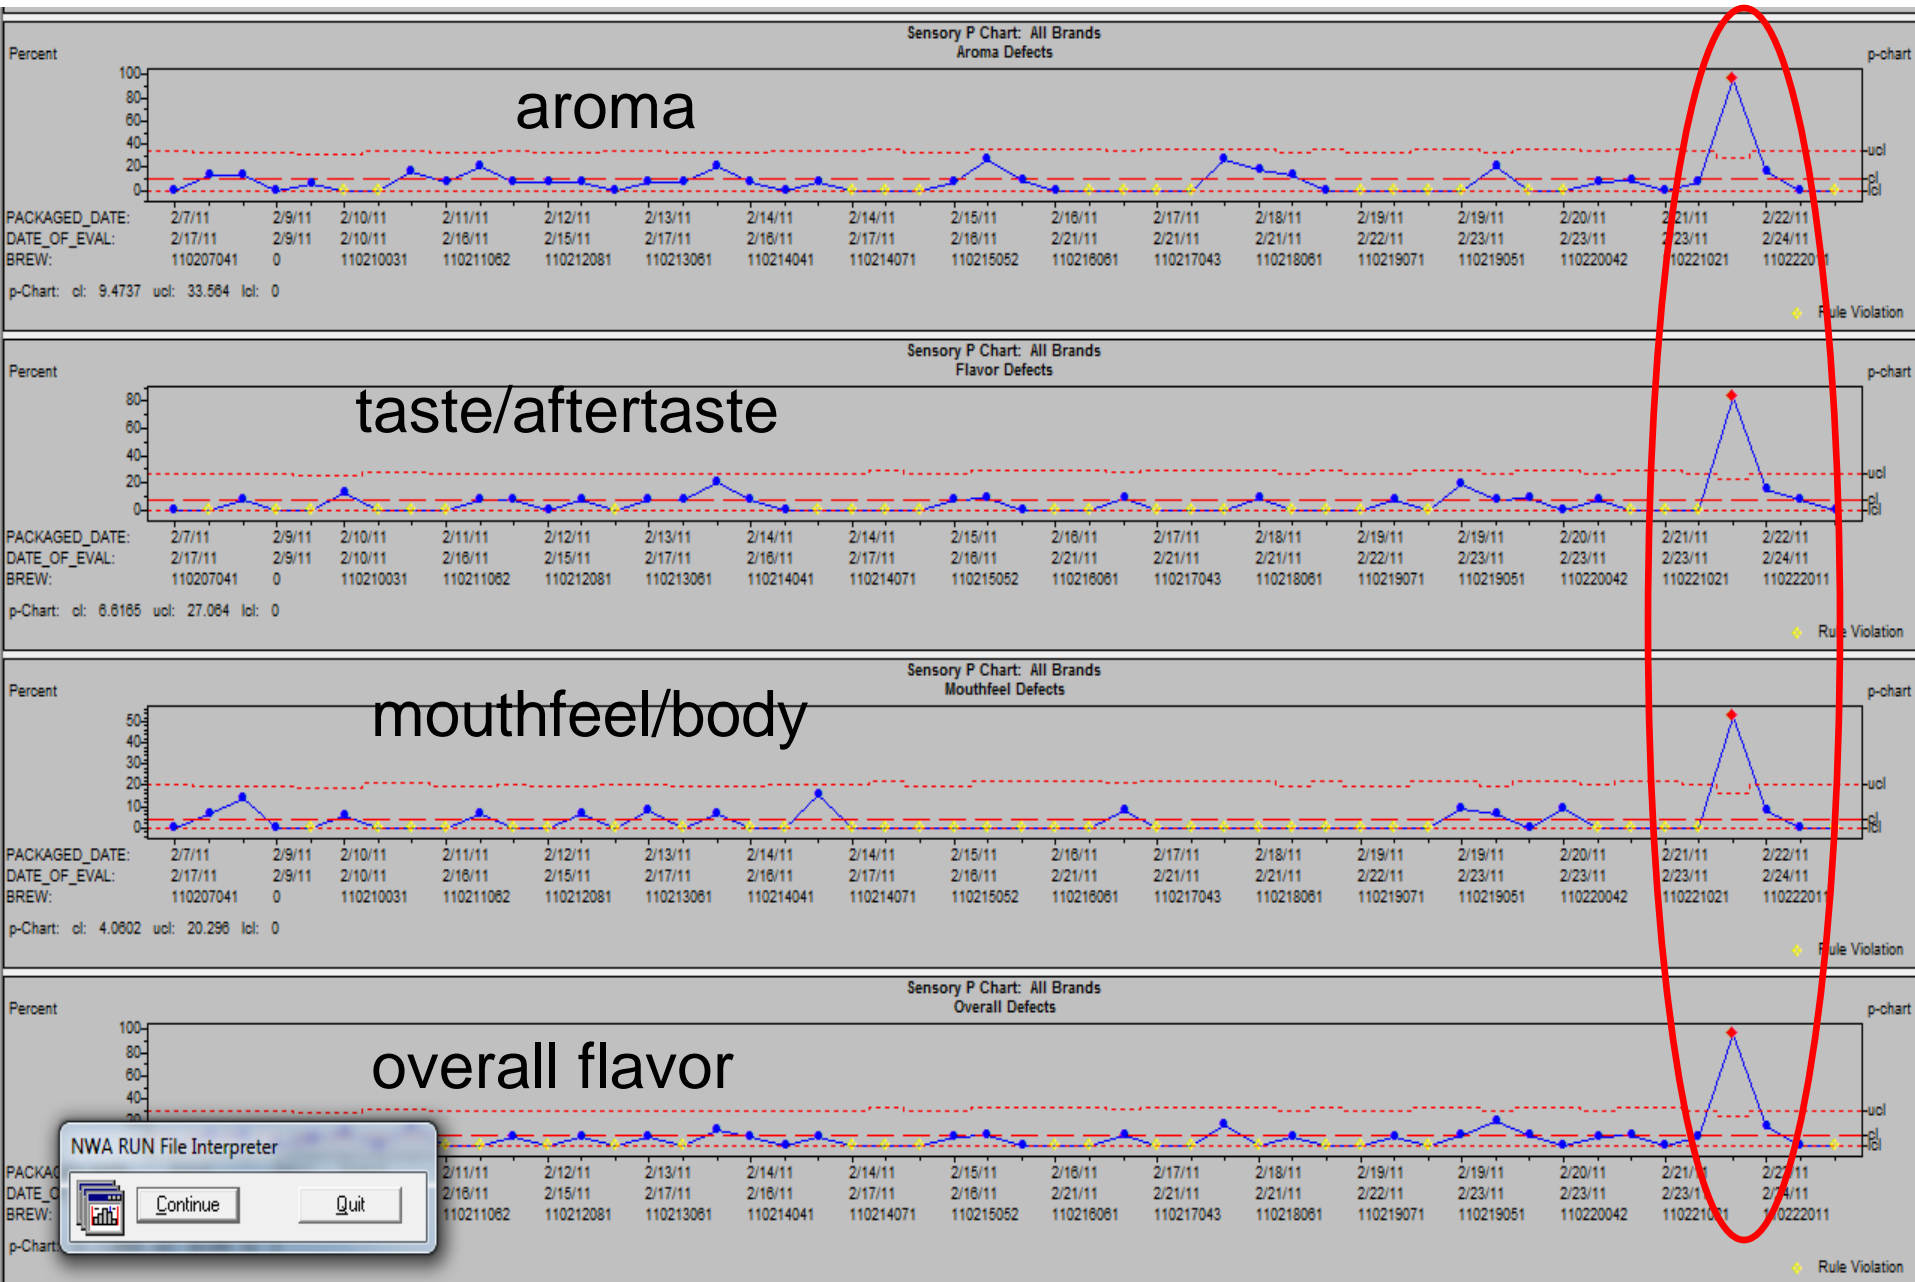

4 out of 5 consecutive points in the same zone B or beyond

14 consecutive points in either zone C

# Is your panel 'plugged in'? Validation via spiked sample.

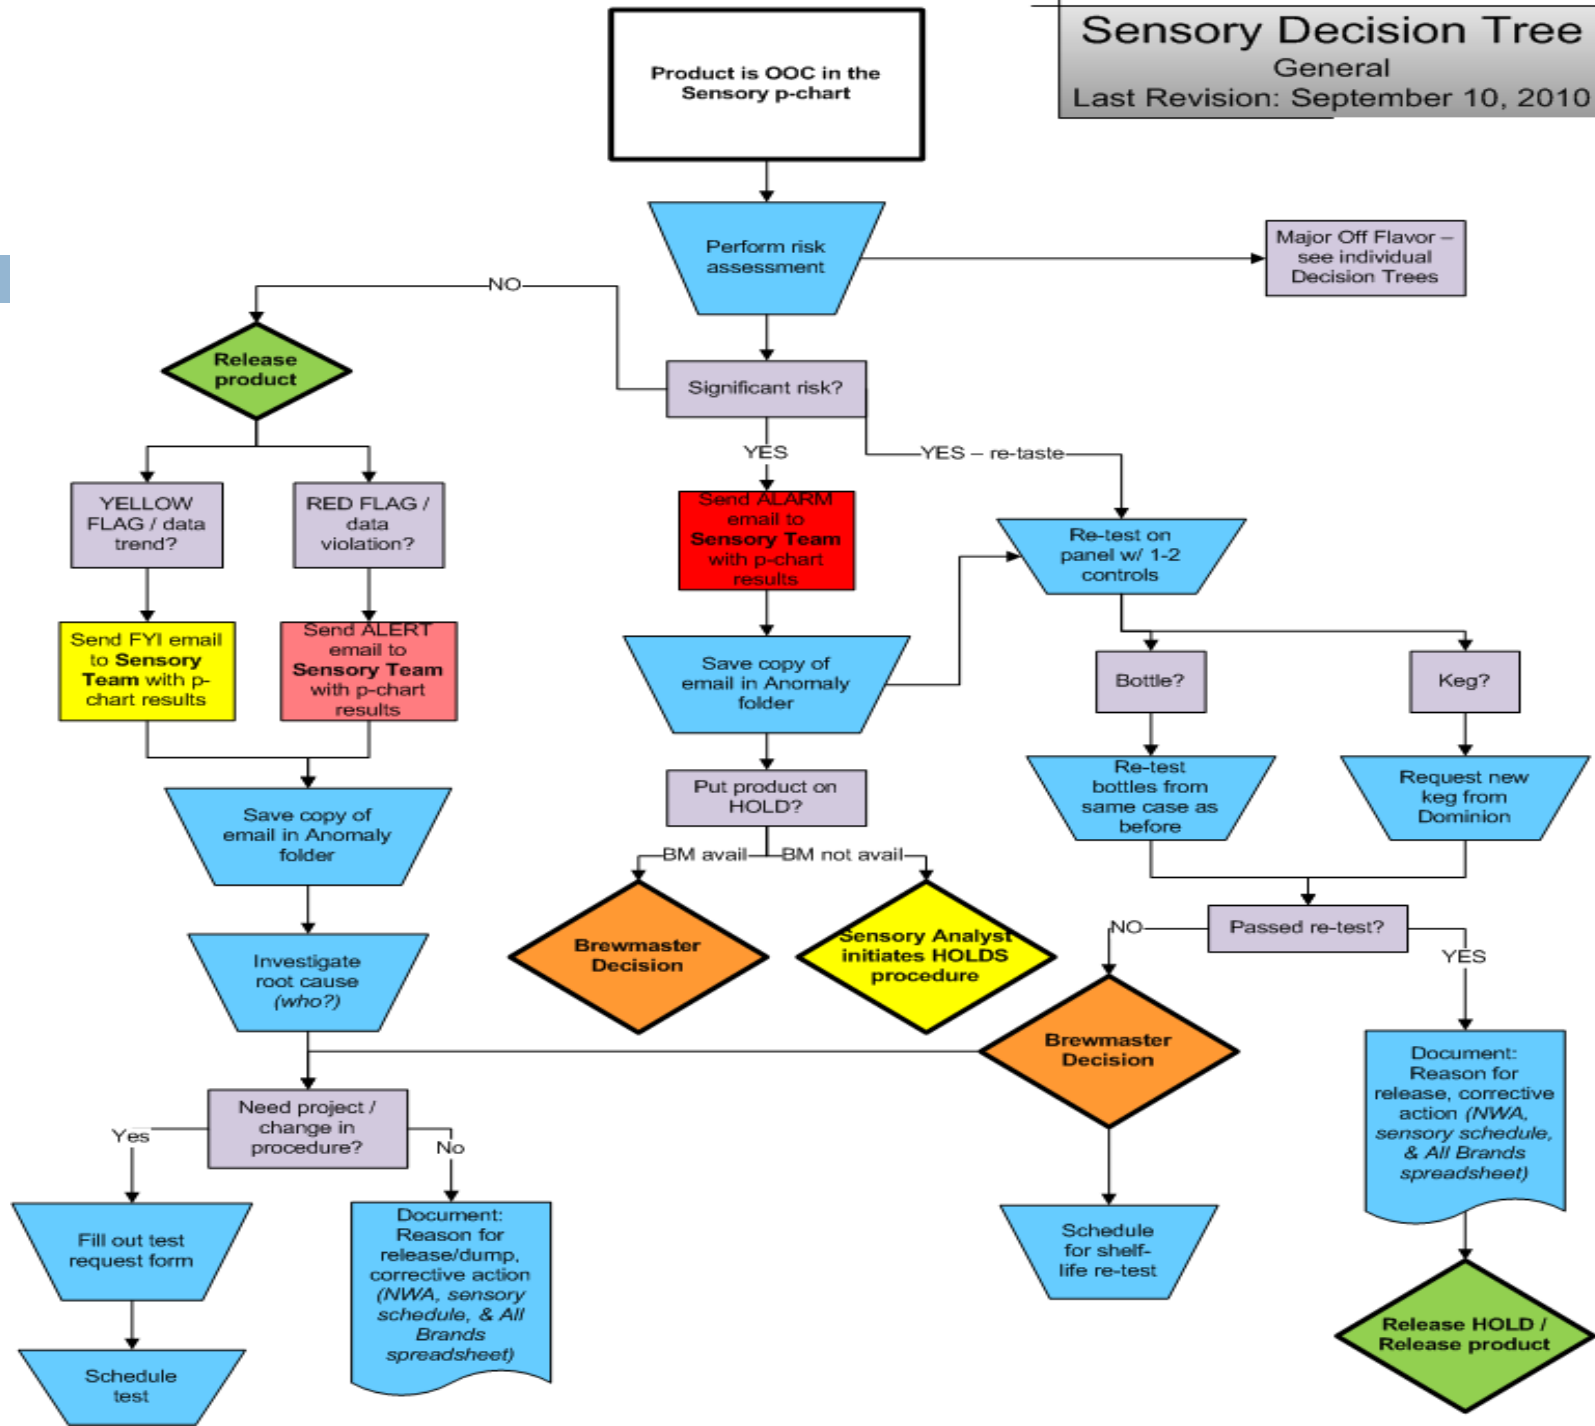

# clarity trend

# Decision tree- FYI/Alert- trend.

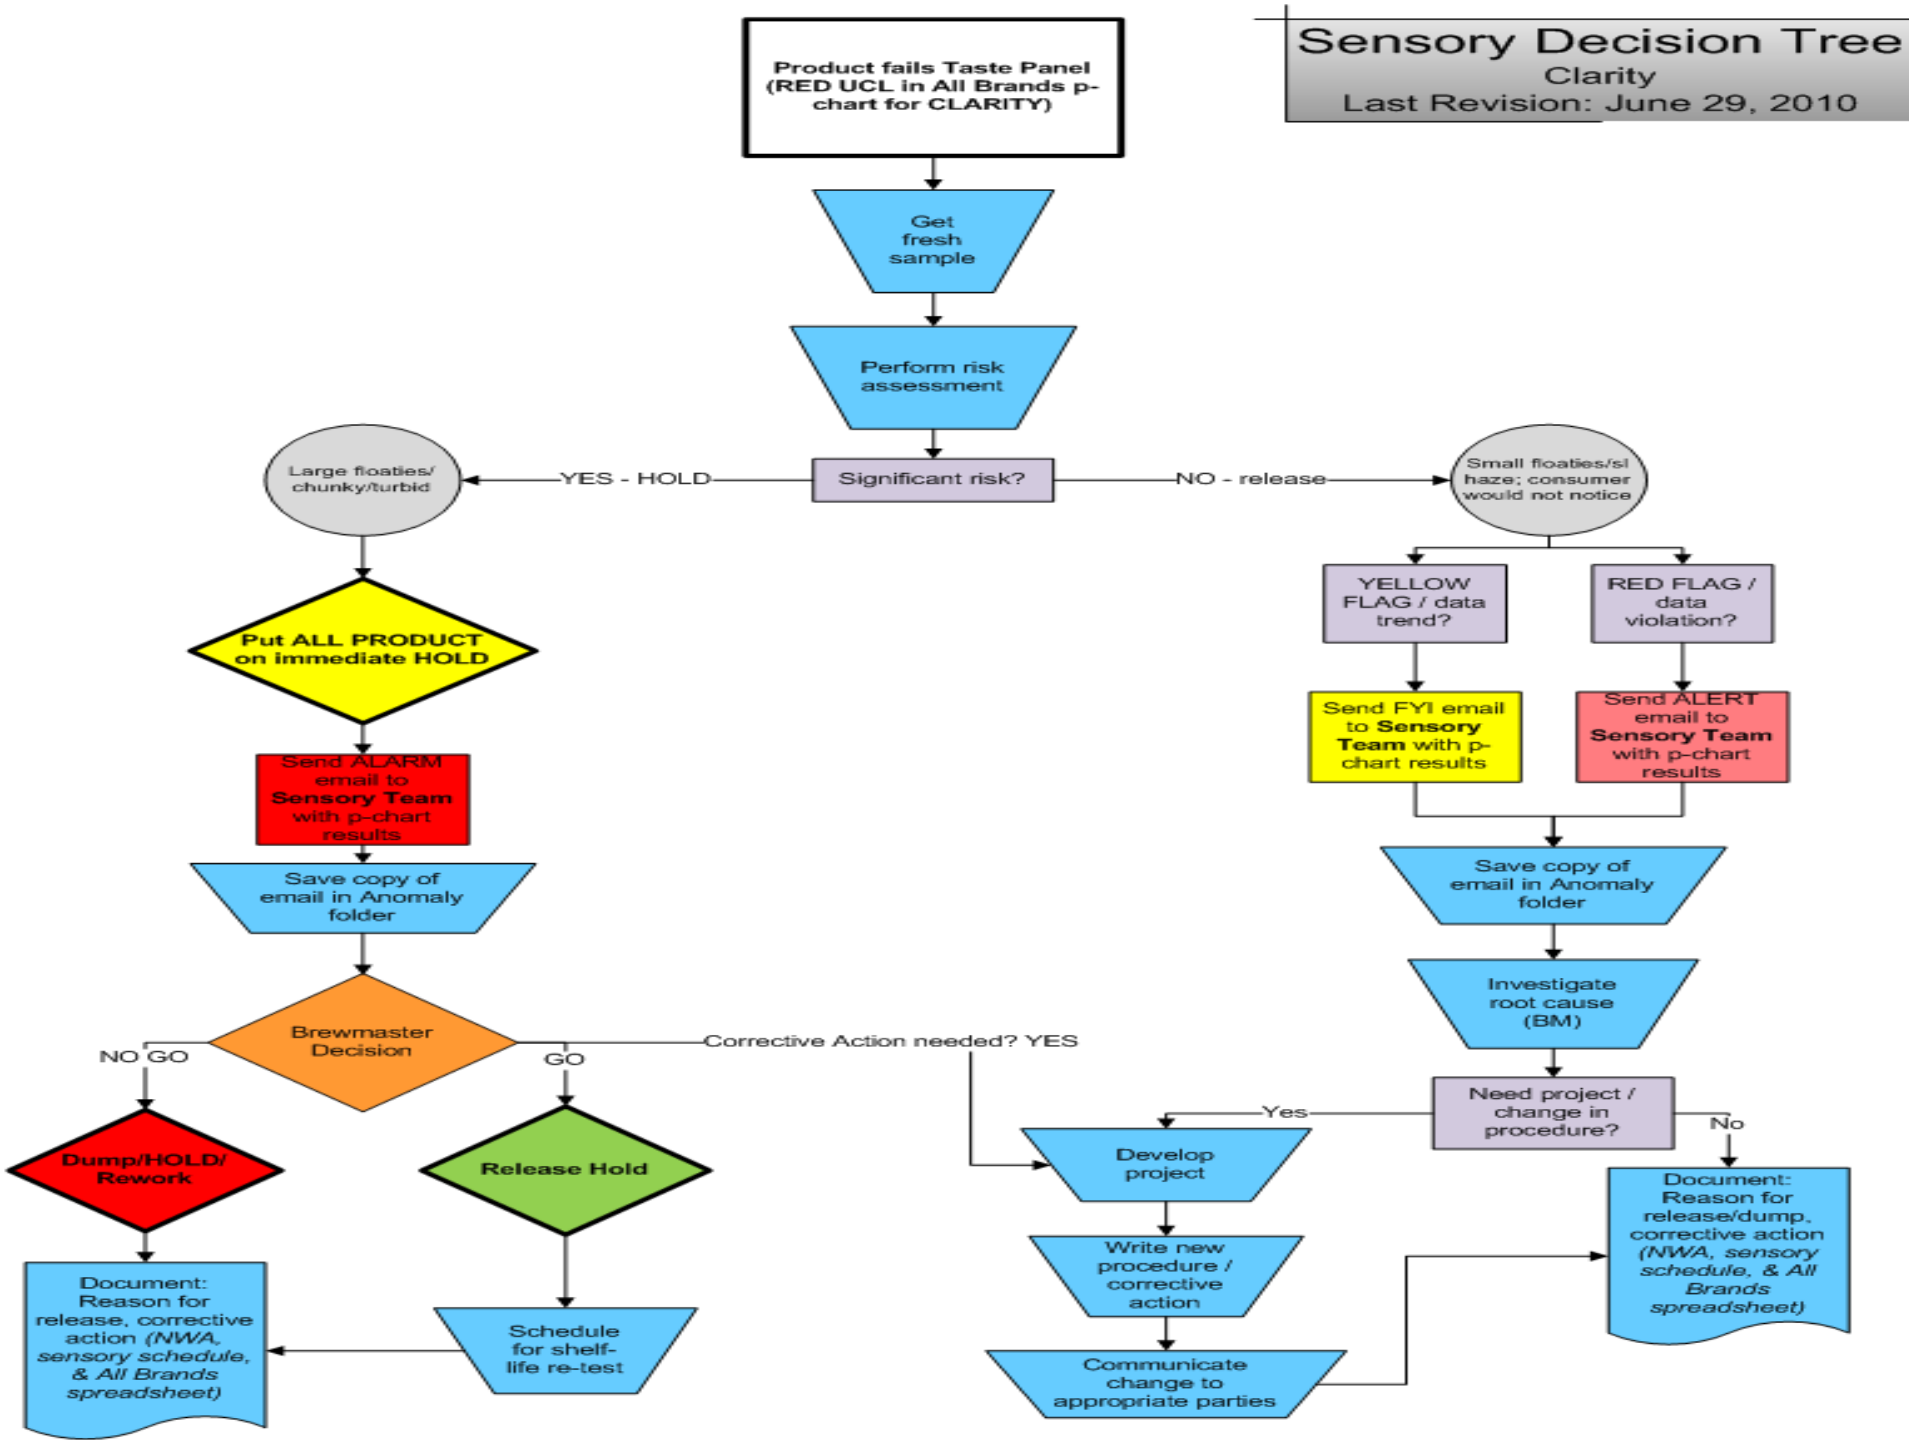

Investigate, report, document, follow up.

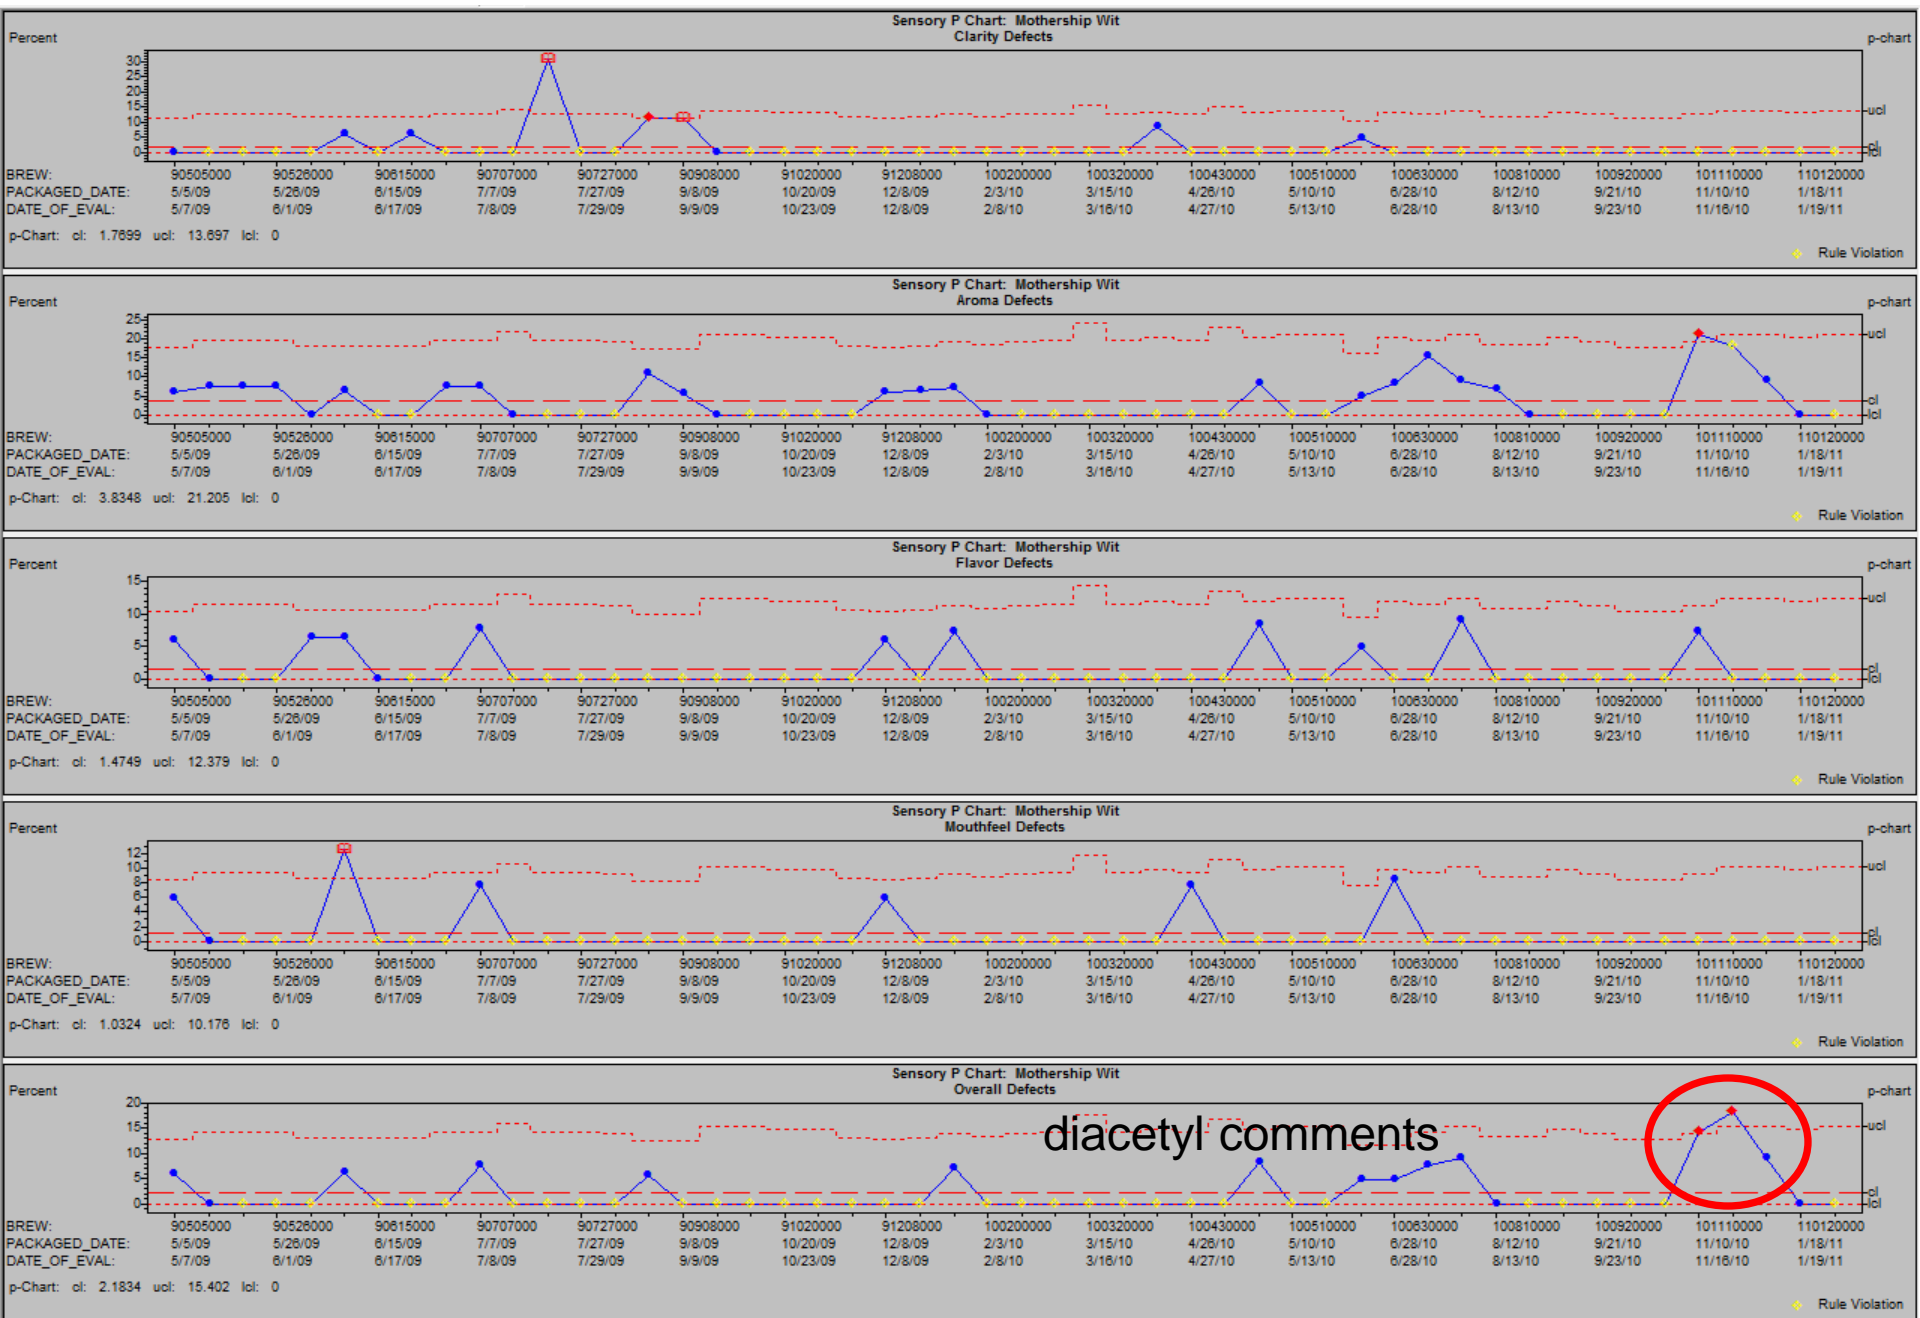

# Sensory Decision Tree

Clarity

Last Revision: June 29, 2010

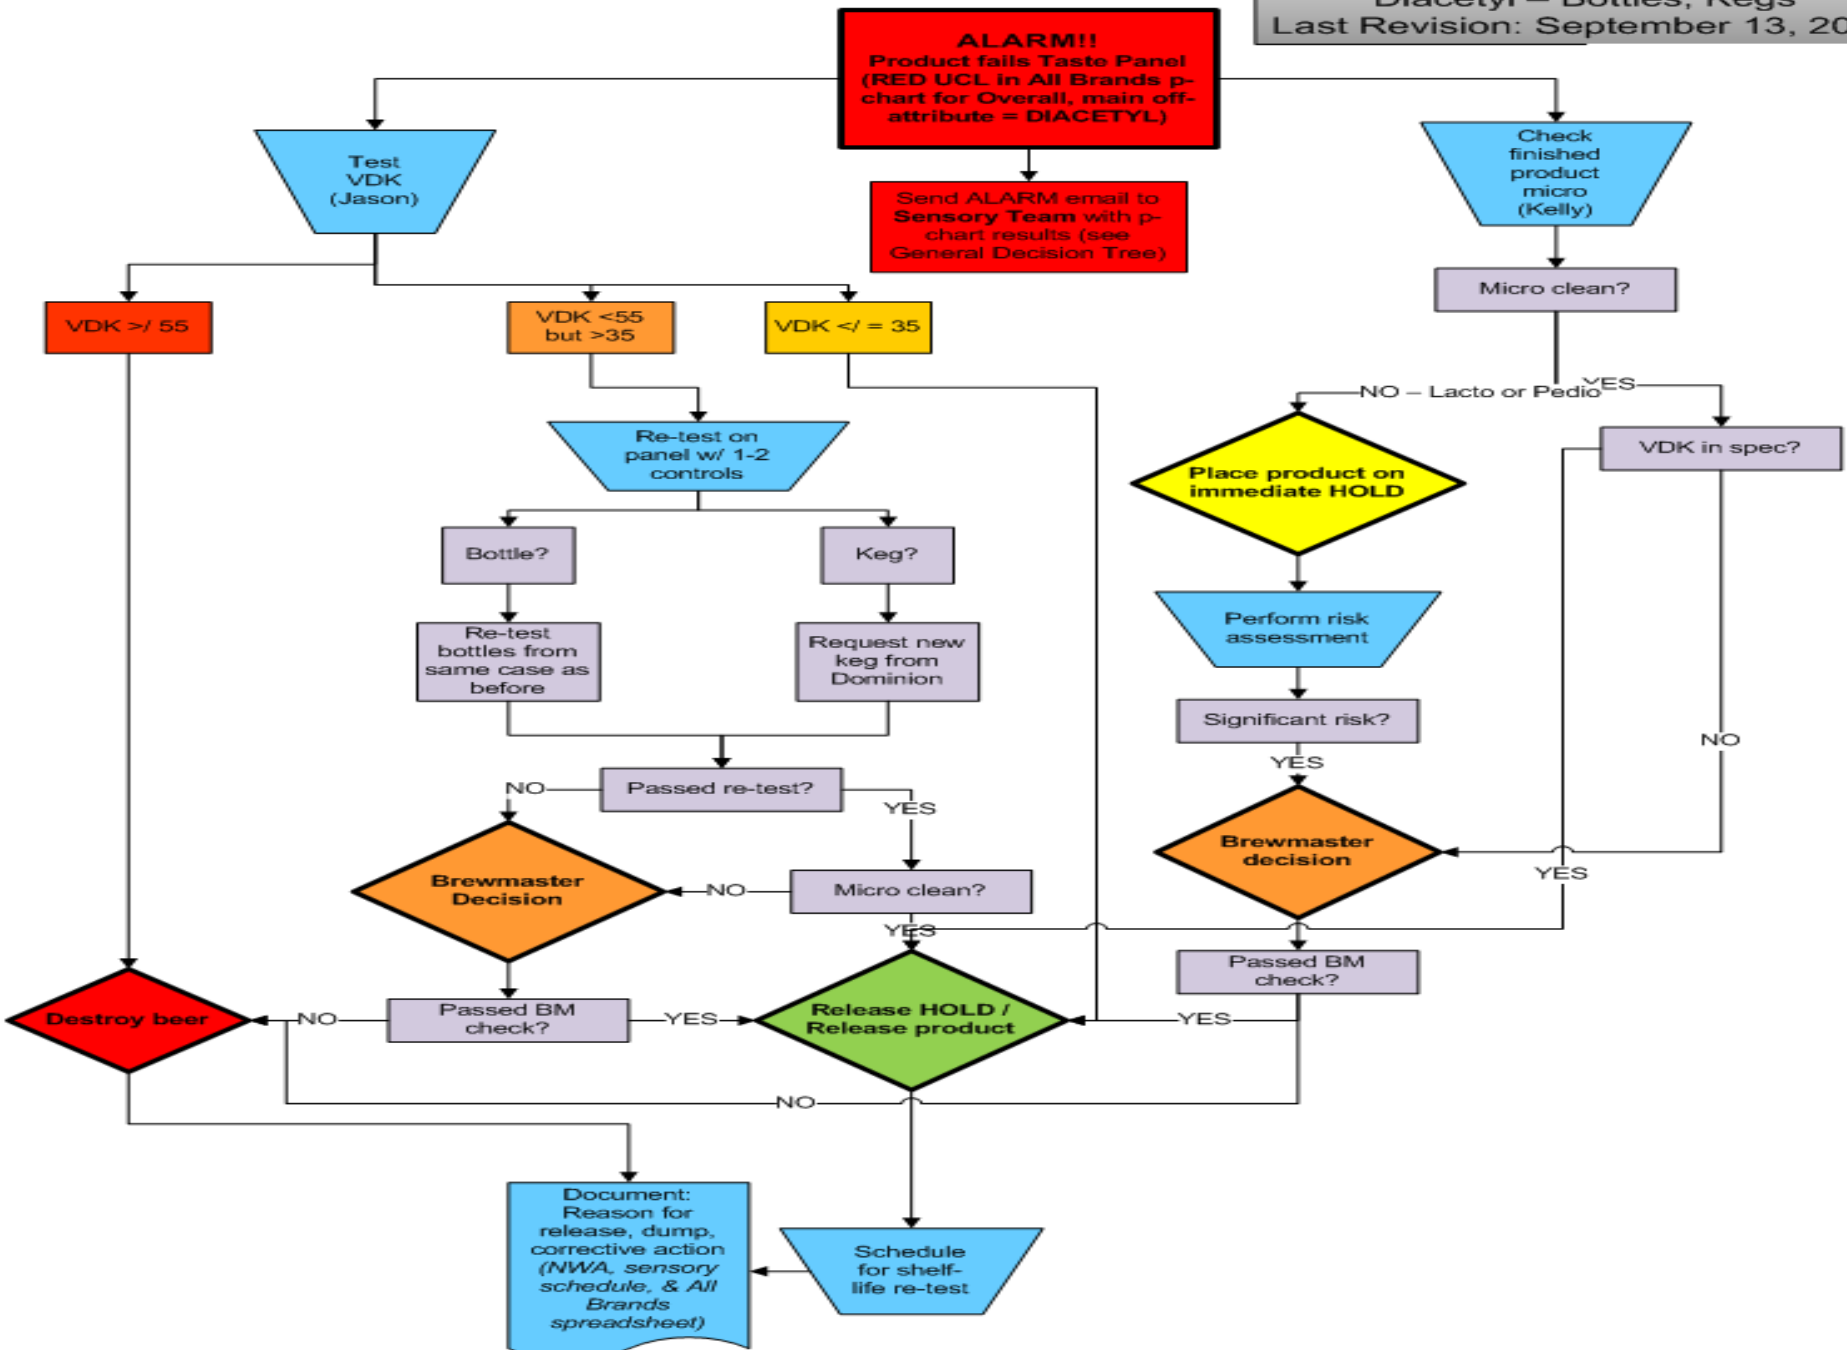

# overall flavor out of control-not true to brand.

# Sensory Decision Tree

Diacetyl – Bottles, Kegs

Last Revision: September 13, 2010

# Each 'out of spec' scenario needs to flow like this

## ... Closed Loop Corrective Action Plan!

- Identify Problem/Attribute (diacetyl comments and red OOC in aroma and overall)
- Assignable Cause (slow fermentation, t-down too early)
- Corrective Action (flag tank, measure diacetyl before t-down)
- Hold the gains (change SOGs, train on new procedure)

# Taste Panel vs. Sensory Program

1. ID process, method, measurement owners
2. Initial Measurement Validation (MSA)
3. Implement and maintain applicable SOG's
4. Training Protocol & Records
5. Establish appropriate charts (Pcharts)
6. On going Validation Method
7. Calibration
8. OOC/OOS Action Plan Development/Decision Trees
9. First Pass Analysis- using OOC/OOS Action Plan
10. Document First Pass Analysis in control chart
11. Cleaning the data set- Brewmaster Ready
12. Trends/Pareto Analysis and Recommendations
13. Present in Quality Meeting
14. Transition to Project/Investigation ideation
