

Wire you shocked?

Electrical safety in the Brewery

Protect equipment? Or people?

Russell A. McCrimmon, O.H.S.T.

This presentation is dedicated to

Content

- Begin with the basics of injury and damage
 - How we prevent injury
 - How we prevent damage
 - Equipment selection
 - Safety by design
- The most basic concepts
 - to more advanced knowledge

To protect equipment?
Or to protect people?

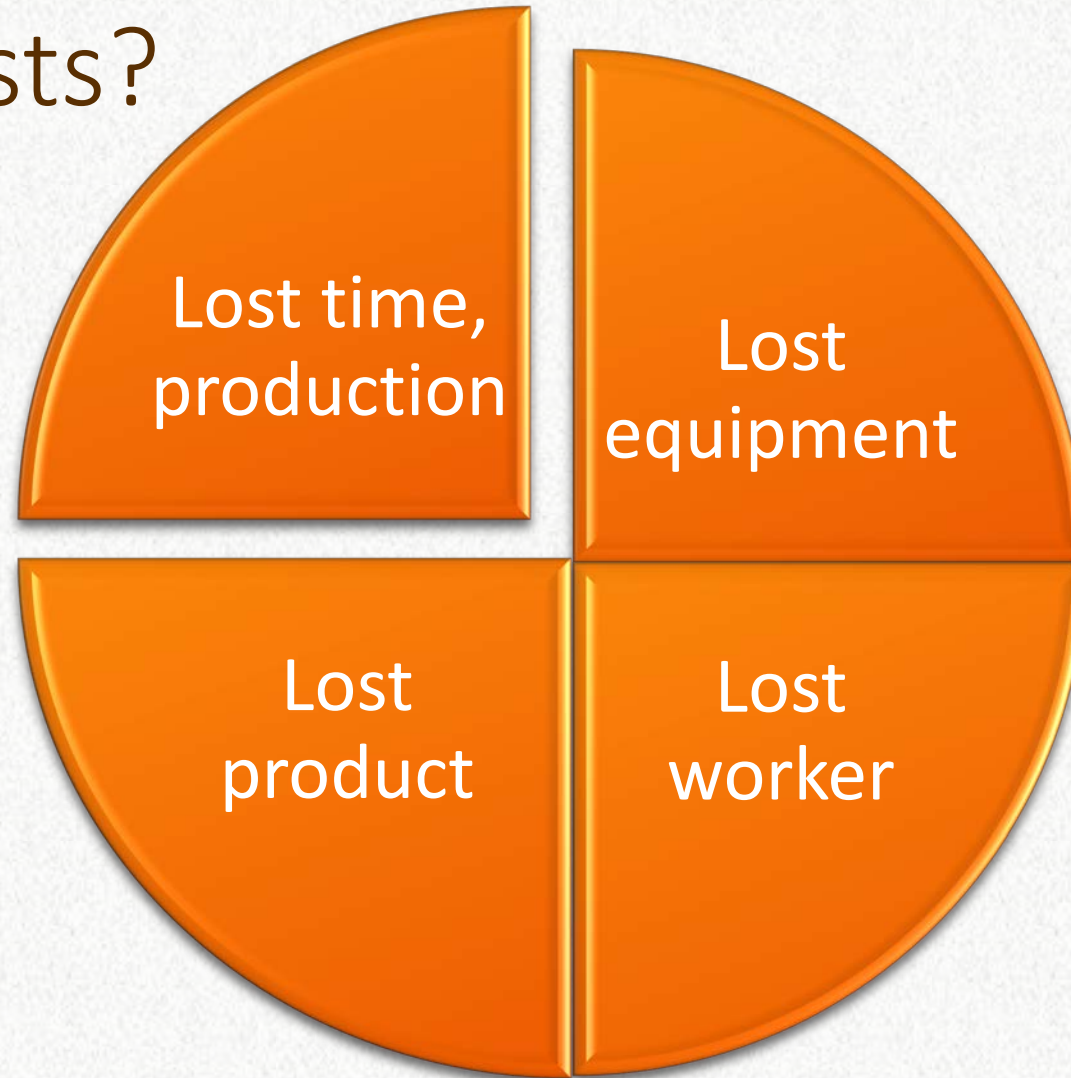

OSHA to BA Safety member:

OSHA can lock your doors, just as quickly as TTB

Cost of injuries

Business costs?

To the Person?

Estimated Average cost

- Employer's direct costs depend on workers' comp "co-pay".
- Employer always pays the indirect costs.
- Additional sales based on 20% profit margin
- "I'll use my personal insurance coverage"??

Injury Type	Direct Cost	Indirect Cost	Total Cost	Additional Sale (Indirect)	Additional Sale (Total)
Electric Shock	\$ 93,858	\$ 103,243	\$ 197,101	\$ 516,219	\$ 985,504
Burn	\$ 40,188	\$ 44,206	\$ 84,394	\$ 221,034	\$ 421,970

fundamentals

- $I = E/r$
- I = current, is the flowing electricity
- E = volts, force that pushes
- r = resistance trying to hold it back
- W = watts of power
- combination of volts and current gives watts
- $745.7 \text{ W} = 1 \text{ Hp}$

Look at your pump motor:
higher voltage, uses lower amperage

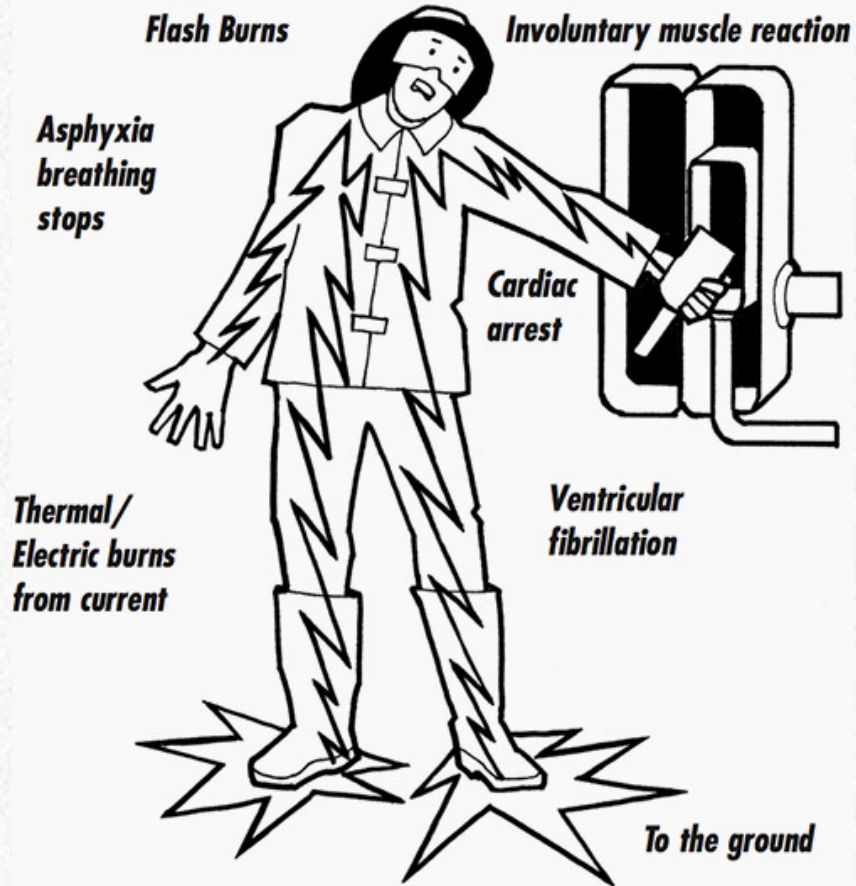

Does a **SHOCK** damage human
cells?

When do I feel a shock?

- When am I in danger?
- Low level electricity causes injury
- Maximum safe voltage only 10V
- Physical affects from **milli**-amps.

CURRENT A/C	PHYSIOLOGICAL PHENOMENA	FEELING OR LETHAL INCIDENCE
60HZ		
< 1mA	None	Imperceptible
1mA	Perception threshold	
2-10mA	Sensation of shock	Not painful, muscle control maintained
5mA		Ground Fault Circuit Interrupter Operates
10-20mA	Paralysis Threshold of Arms	Cannot release hand grip, victim may be thrown clear
20-50mA	Respiratory Paralysis	Breathing Stoppage (frequently fatal)
50-100mA	Fibrillation Threshold (0.5%)	Heart action discoordinated (probably fatal)
100-200mA	Fibrillation Threshold (99.5%)	
>200mA	Tissue Burning	Non fatal unless vital organs are burned

Electrical safety

- Amps are from Voltage and Resistance
- Body resistance can be 500 ohms.
- 1000 ohms is realistic for wet, intact skin.
- Broken skin has less resistance
- Voltage breaks down skin cells.
- Lowers resistance.

Quoting: OSHA Letter Of Interpretation 9/4/2015

- Current causes injury, not voltage.
- Current passing through depends on resistance.
- Resistance of the body can be as low as 500 ohms.
- 60 volts through 500 ohms is 120 milliamperes; enough for serious injury.
- Documented serious injuries are proof that below 50V is dangerous.
- Auto mechanics: 12-volt at 24 milli-amps.

Power of electricity

Hire an industrial or commercial electrician

By The Numbers

How Often	Number	Effect
United States Annual Average	4,000	Non-Disabling electrical contact injuries
United States Annual Average	3,600	Disabling electrical contact injuries
Every Day	1	Person is electrocuted in the workplace
Electrocutions are	4 th	Leading cause of traumatic occupational fatalities
Each year	+2,000	Workers are sent to burn centers with electrical burns

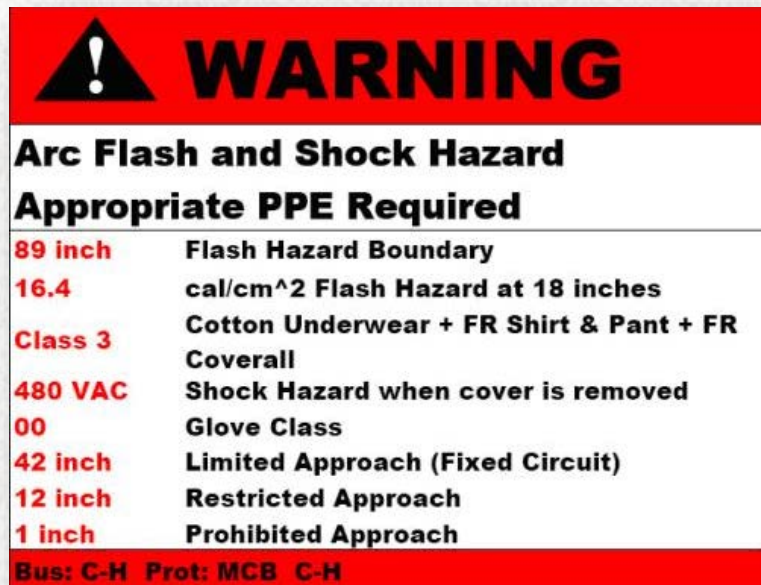

- “Switch” doesn’t kill power in circuit
- Shut off power at breaker
- **1** electrocution per day
- **6** electrical burns per day
- **2 of 3** are worker error
- Arc Flash is not “shock”

NFPA 70e HOST AND CONTRACT EMPLOYERS' RESPONSIBILITIES

- **110.3(A)** Host employer **communicates hazards to contractor**
- Include info the contractor needs to assess safety
- **110.3(B)** Contractor trains employees on electrical safety
- Communicates **hazards identified by the host**
- Contractor must report to host, any new hazards
- **110.3(C)** “...shall be **documented meeting** between host and contractor.”

NFPA 70e HOST AND CONTRACT EMPLOYERS' RESPONSIBILITIES

! WARNING

Arc Flash and Shock Hazard
Appropriate PPE Required

89 inch	Flash Hazard Boundary
16.4	cal/cm² Flash Hazard at 18 inches
Class 3	Cotton Underwear + FR Shirt & Pant + FR Coverall
480 VAC	Shock Hazard when cover is removed
00	Glove Class
42 inch	Limited Approach (Fixed Circuit)
12 inch	Restricted Approach
1 inch	Prohibited Approach

Bus: C-H Prot: MCB C-H

- Electrical schematic drawings
- Questionable, faulty circuits
- Circuit Voltage and amperage
- Proper labels that Identify

That means

I AM RESPONSIBLE

for my **electrician**

going home in one piece

Electrical safety NFPA 70e Rev 2015

- Do you see the problem here?
- Only a **properly protected** electrician should touch this
- This will **kill**
- By arc
- Or by direct shock

Shock and Arc magnified by water and dust

- **Helps electricity travel** across easier
- Minerals and dust in water are more conductive
- Dust in **air or on exposed** circuits
- More impure, more conductive

Prevention vs. protection

Codes, Regulations, Basic good electrical practice

- National Electrical Code
- NFPA
- ANSI
- ASTM
- Factory Mutual
- CE
- Underwriter's Laboratory
- Am Society of Safety Engineers
- OSHA Subpart S Electrical
- NFPA 70
- NFPA 70e
- UL listings

Electrical 1910.303 to 1910.399

- No openings in boxes or covers
- Use it as it's engineered
- Rated for necessary amps
- Switches vs. Disconnects
- Equipment access in emergency
- No cords through doors, openings, walls, etc.

Keep access clear for emergency shut off

CAUTION
AREA IN FRONT OF THIS
ELECTRICAL PANEL MUST BE
KEPT CLEAR FOR 36 INCHES.
OSHA-NEC REGULATIONS

TING

1910.307 Hazardous locations

- Electrical equipment in dust environments
- Includes lights, motors, cords...
- Includes exit signs, emergency lights, etc.

Fast Fact:

Dust build-up on equipment causes it to OVERHEAT,
and can ignite the surrounding atmosphere.

Class II equipment must resist this “dust blanket”.

- Correct equipment for the job
- Ground all cords and equipment
- Cords almost as good as new
- Inspect it, if it can be damaged
- Water will puddle in these strain reliefs

Current and cords

Selecting extension cords

- Protective jacket over insulated conductors
- The gray cord design shown is illegal
- Read instructions for proper use and power capacity.
- Select cords rated for your current
- Thick, round, big gauge, high amp cords

Longer cord lower amp capacity

W: Suitable for outdoors (wet)

Read cord's jacket:

S- general use

W- suitable for outdoors

J- 300 V insulation; without a J is 600 V

P- parallel wiring, used indoors

O- oil-resistant cord

T- vinyl thermoplastic jacket

E- thermoplastic elastomer rubber jacket

• **SJTW**

On this cord, SJTW indicates the jacket type and AWG 18/3 indicates the gauge rating.

Tips To Remember

- **Never use extension cords.**
- Extension cords are **fire and safety** risks.
- Use Outdoor-Rated, Wet location Cords
- Wet cords are moisture-resistant.
- Larger gauge wires for larger equipment.
- Indoor cords are for living rooms.

Stop using a warm or hot cord

- Don't connect multiple cords.
- Never tape, staple, nail up cords
- Don't bend or coil cords in use.
- Keep cords out from under feet
- These magnify heat gain
- Heat damages materials
- Increase damage, increase danger

Cord plug safety

- Outlet and cover plate get hot
- Plug ends gets hot at outlet box
- Both plugs get hot
- Entire cord gets hotter

Hot cords

- Current heats cords
- Inductive coupling magnifies heat

Caring for extension cords

- Unplug unused cords.
- Pull on the plug — not the cord.
- Cords are temporary; add more outlets
- Avoid touching equipment or breakers when wet

Caring for extension cords

- Unplug from outlet first, then tool
- Power arcs across the connection

Relocatable power tap

Overloaded electric outlet strip

- Not designed for excess amp draw
- Cannot be permanently mounted
- Must disconnect daily

Grounding versus GFCI

Grounds are path of least resistance

- Dissipate voltage and current if malfunctions
- Test for resistance less than 25 ohms
- Electricity uses path of least resistance

To reduce:

- Electric shock
- Equipment damage
- Time lost during repair
- Cost

Ground and Over Current Protection

OCP, breakers

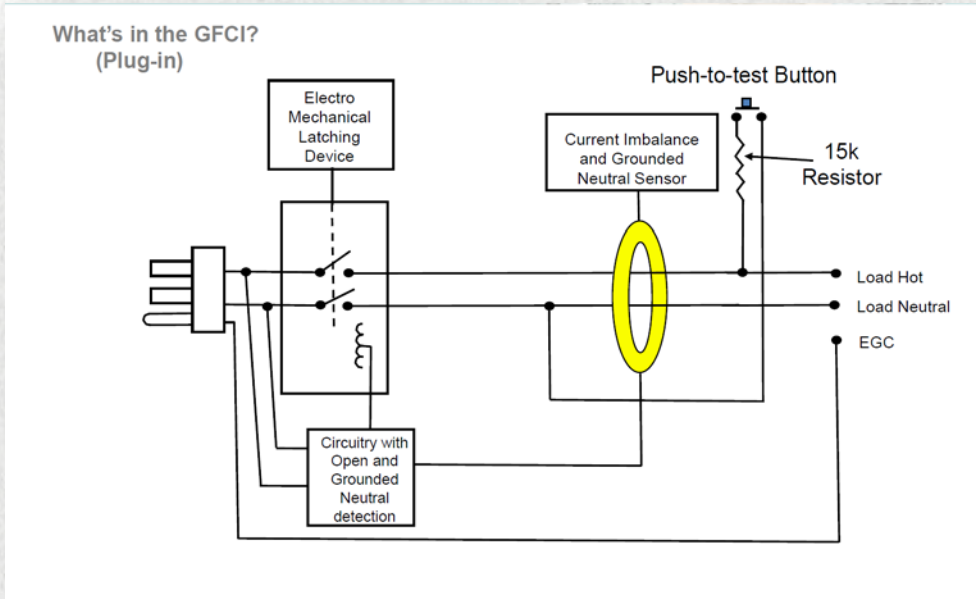

- 10 amp circuit
- 15 amp
- 25 amp
- 50 amp
- Require ground

GFCI

- 4-6 milli-amps
- Less than 40 milliseconds
- Don't require ground

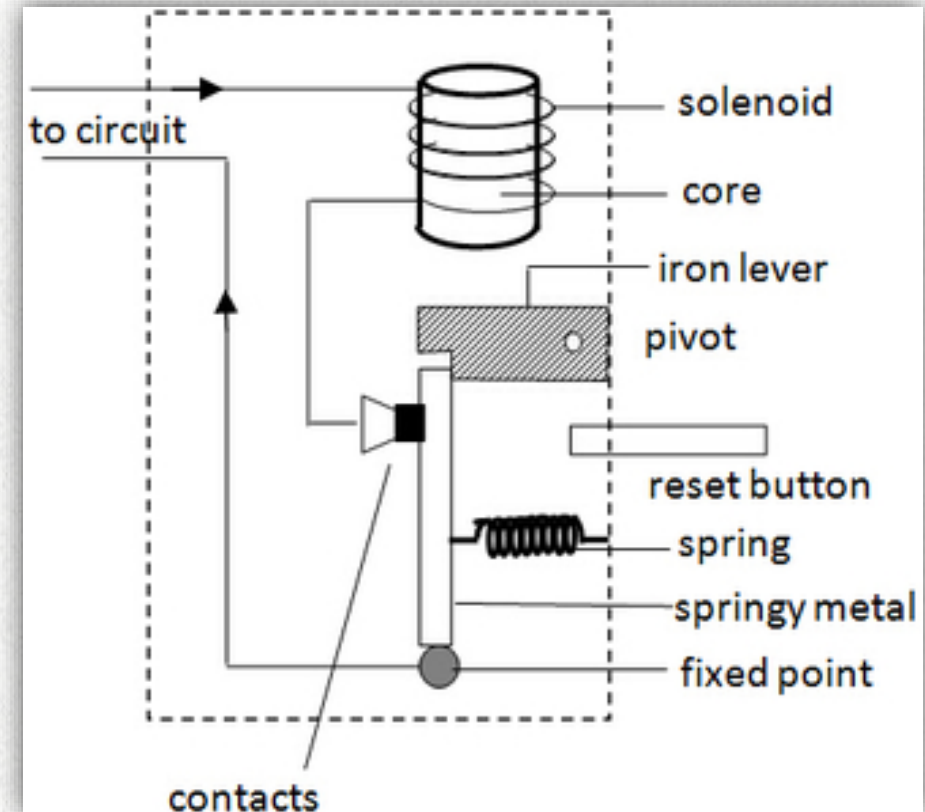

Ground Fault Circuit Interrupters vs. OCP

Both are switches

- GFCI trip 4-6 mA and 1/40 second

OverCurrent Protection Trips when?

Current Level

- Breakers eliminate or minimize damage
- Outbound current is compared to return current
- Measures the **difference in current**
- GFCI protects from electrocution by paralysis

Current Magnitudes

CURRENT A/C	PHYSIOLOGICAL PHENOMENA	FEELING OR LETHAL INCIDENCE	DC Current	Physiological Phenomena
60HZ				
< 1mA	None	Imperceptible		
1mA	Perception threshold			
2-10mA	Sensation of shock	Not painful, muscle control maintained	0-4 mA	Perception Threshold
5mA		Ground Fault Circuit Interrupter Operates	4-15 mA	Surprise
10-20mA	Paralysis Threshold of Arms	Cannot release hand grip, victim may be thrown clear	15-80 mA	Reflex Action
20-50mA	Respiratory Paralysis	Breathing Stoppage (frequently fatal)	80-160 mA	Muscular Inhibition
50-100mA	Fibrillation Threshold (0.5%)	Heart action discoordinated (probably fatal)	160-300 mA	Respiratory Failure
100-200mA	Fibrillation Threshold (99.5%)		>300 mA	Usually Fatal
>200mA	Tissue Burning	Non fatal unless vital organs are burned		

Misconception

- I won't get a shock
- Oh yes, I will!

Current Magnitudes

CURRENT A/C 60HZ	PHYSIOLOGICAL PHENOMENA	FEELING OR LETHAL INCIDENCE
< 1mA	None	Imperceptible
1mA	Perception threshold	
2-10mA	Sensation of shock	Not painful, muscle control maintained
5mA		Ground Fault Circuit Interrupter Operates
10-20mA	Paralysis Threshold of Arms	Cannot release hand grip, victim may be thrown clear
20-50mA	Respiratory Paralysis	Breathing Stoppage (frequently fatal)
50-100mA	Fibrillation Threshold (0.5%)	Heart action discoordinated (probably fatal)
100-200mA	Fibrillation Threshold (99.5%)	
>200mA	Tissue Burning	Non fatal unless vital organs are burned

DC Current	Physiological Phenomena
0-4 mA	Perception Threshold
4-15 mA	Surprise
15-80 mA	Reflex Action
80-160 mA	Muscular Inhibition
160-300 mA	Respiratory Failure
>300 mA	Usually Fatal

GFCI

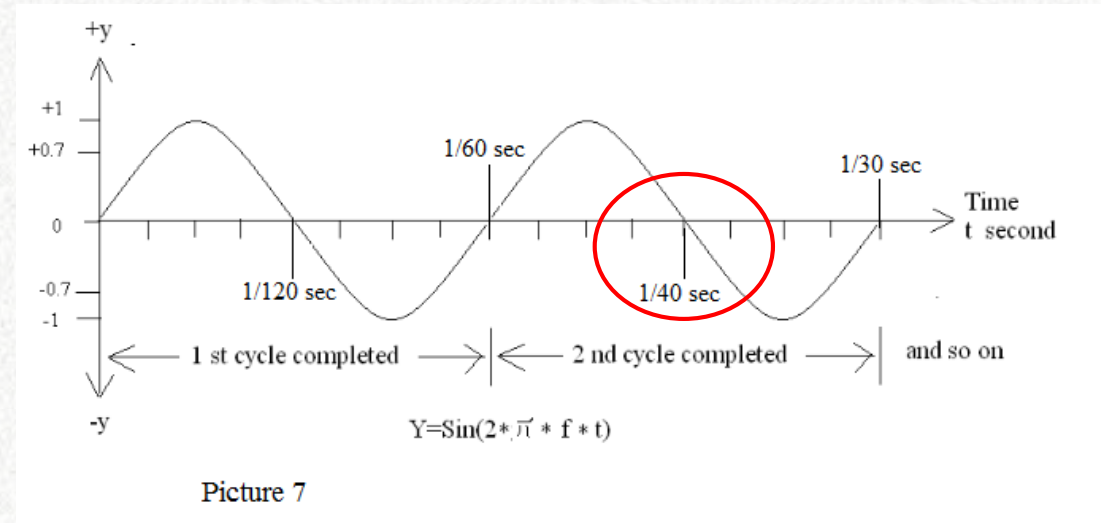

Portable GFCI outlets, plugs into any outlets.
Must say is “waterproof”.

National Electrical Code and OSHA

Require GFCI in all **wet area** circuits

Both Inside and Outdoors

Documented monthly tests

GFCI trip 4-6 mA and 1/40 second

Safe Work Practices

- May be free!
- Teach every person
- Never assume they know
- Best Management Practices

Safe work practices

- Close panels
- Clean dust out of panels
- Minimize extension cords
- Squeegee floors
- Reduce water
- Dust off electrical equipment

Poor design of adjustments

Electrical maintenance

- Clean dust out of breaker panels
- Friend had 2 dust fires in breaker panels
- Procedure to check and clean regularly
- Shut off power to the panel

Safe practices for less than a couple bucks

- Machine guards limit travel of splash.
- De-energize all electrical
- Verify it's de-energized
- Lockout
- Always assume power is turned on:
- Chris was told it was de-energized
 - BELIEVED, so didn't verify
 - THEN IT zapped HIM
 - SHOCKING!

Safety by design

Adding outlets

Hard wired or plug-in

Support entire cord with cable to plug end

Avoid use of extension cord

- Short cord with waterproof plug (this one plugs into the hanging cord)
- Long cord out of wet area

Correct motor on transfer pump?

Inverter Duty Motor

- Dust?

- Dust?

Explosion proof vs water tight

Emergency motor shut off

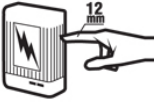

- Motor's power disconnect is “within sight of” the motor.
- OSHA says **this “within sight”** is less than 50 feet.
- Disconnect is “easy to reach”
- Clearly indicates (off) or (on)
- If mounted vertical, (off) is always down

Accessible disconnects and outlets

IP: Ingress Protection for sensors

IP (Ingress Protection) Ratings Guide

SOLIDS		WATER	
1	 <p>Protected against a solid object greater than 50 mm such as a hand.</p>	1	 <p>Protected against vertically falling drops of water. Limited ingress permitted.</p>
2	 <p>Protected against a solid object greater than 12.5 mm such as a finger.</p>	2	 <p>Protected against vertically falling drops of water with enclosure tilted up to 15 degrees from the vertical. Limited ingress permitted.</p>
3	 <p>Protected against a solid object greater than 2.5 mm such as a screwdriver.</p>	3	 <p>Protected against sprays of water up to 60 degrees from the vertical. Limited ingress permitted for three minutes.</p>
4	 <p>Protected against a solid object greater than 1 mm such as a wire.</p>	4	 <p>Protected against water splashed from all directions. Limited ingress permitted.</p>
5	 <p>Dust Protected. Limited ingress of dust permitted. Will not interfere with operation of the equipment. Two to eight hours.</p>	5	 <p>Protected against jets of water. Limited ingress permitted.</p>
6	 <p>Dust tight. No ingress of dust. Two to eight hours.</p>	6	 <p>Water from heavy seas or water projected in powerful jets shall not enter the enclosure in harmful quantities.</p>
		7	 <p>Protection against the effects of immersion in water between 15 cm and 1 m for 30 minutes.</p>
		8	 <p>Protection against the effects of immersion in water under pressure for long periods.</p>

Rating Example:

IP65

INGRESS PROTECTION

- **6** is dust tight
- 2nd digit is **water ingress**:
- **IP65**: low pressure spray with limited ingress.
- **IP66**: strong jets with limited ingress.
- **IP67**: 30 min. immersion without ingress.
- **IP68**: submerge without water ingress.
- **IP69K**: high pressure, high temp wash-downs, as in food processing.

Water proof? versus explosion proof

OPENINGS DESIGNED INTO THREADED JOINT

ERY

SCALES
www.vbssys.com • 712.722.1181

Wash down duty

- Wash down duty motors are not air-tight.
- Have condensate drain holes
- Holes breathe as they heat and cool
- If the drain holes are up, water runs in
- You can get shocked
- “...wash down isn’t wash down!” -Simmons

UL 508A

- Industrial control panels
- Spacing of components
- Calculates for heat created
- To minimize, dissipate component heat
- Limit potential for fire
- Increase life of components

UL508A helps equipment last

- Too small for heat and trips
- Has to run with door open
- Oversized so equipment is cool
- Runs without a hiccup
